**AIM:** To create a private ethereum blockchain using Ganache and Truffle

**Objective:** To create private ethereum blockchain and deploy smart contract on it

### Theory:

Smart contracts are programs stored on a blockchain. The term 'smart contract' was first coined by Nick Szabo in 1994. It's a collection of code (its functions) and data (its state) that resides at a specific address on the Ethereum blockchain. One of the main features is that they are immutable once deployed on the blockchain. Solidity and Vyper are the two most active programming languages used to write smart contracts on the Ethereum blockchain with Solidity being the top choice for most developers as it is an object-oriented, statically-typed language and is strongly influenced by more popular OOP languages like JavaScript and C++.

### Ganache

Ganache is a personalized blockchain for Ethereum development. It can be used to run tests, execute commands, and inspect states while controlling how the chain operates. Ganache is an Ethereum simulator that makes developing Ethereum applications faster, easier, and safer. It is provided by Truffle Suite and can be downloaded from <https://www.trufflesuite.com/ganache>. The below image shows the view of Ganache

Fig.8.1 Ganache view

### Truffle

Truffle is the most popular development framework for Ethereum. Truffle takes care of managing your contract artifacts so you don't have to. Includes support for custom deployments, library linking and complex Ethereum applications. Truffle is used to test contracts in both javascript and solidity.

### Process:

Step 1. Install Ganache , Download Ganache from the website <https://truffleframework.com/ganache>

Step 2. Install Truffle by executing the following command at the command prompt:

```
npm install -g truffle
```

To install Truffle you need to have Node and NPM along with Python setup on your machine.

Step 3. To verify if Truffle is installed successfully, execute the following command at the command prompt.

```
truffle version
```

Step 4. To start a project in Truffle, go into a directory and type the init command:

```
truffle init
```

This will create a new project with the required directory: contracts, migrations, test

Step 5. Create the required contract file in solidity and save it in the contracts directory

Step 6. Create a migration file in javascript and save it in migrations directory

Step 7. Run the following command to deploy the contract on Ganache

# Vidyavardhini's College of Engineering & Technology

## Department of Computer Engineering

---

truffle Test

Ganache should be running while executing this command. The contract deployed will be visible in the contracts tab of the Ganache.

### Code:

Election.sol

```
pragma solidity ^0.5.16;

contract Election {

    // Model a Candidate

    struct Candidate {

        uint id;

        string name;

        uint voteCount;

    }

    // Store accounts that have voted

    mapping(address => bool) public voters;

    // Read/write candidates

    mapping(uint => Candidate) public candidates;

    // Store Candidates Count

    uint public candidatesCount;
```

# Vidyavardhini's College of Engineering & Technology

## Department of Computer Engineering

---

```
constructor () public {  
  
    addCandidate("Candidate 1");  
  
    addCandidate("Candidate 2");  
  
}  
  
function addCandidate (string memory _name) private {  
  
    candidatesCount ++;  
  
    candidates[candidatesCount] = Candidate(candidatesCount, _name, 0);  
  
}  
  
function vote (uint _candidateId) public {  
  
    // require that they haven't voted before  
  
    require(!voters[msg.sender]);  
  
    // require a valid candidate  
  
    require(_candidateId > 0 && _candidateId <= candidatesCount);  
  
    // record that voter has voted  
  
    voters[msg.sender] = true;  
  
    // update candidate vote Count  
  
    candidates[_candidateId].voteCount ++;}  
  
}
```

## 2\_deploy\_contracts

```
var Election = artifacts.require("./Election.sol");
```

```
module.exports = function(deployer) {
```

```
    deployer.deploy(Election);
```

```
};
```

## Output:

```
C:\Windows\system32\cmd.exe
Microsoft Windows [Version 10.0.22000.2416]
(c) Microsoft Corporation. All rights reserved.

C:\Users\student\Election1>truffle version
Truffle v5.11.5 (core: 5.11.5)
Ganache v7.9.1
Solidity - 0.8.21 (solc-js)
Node v18.18.0
Web3.js v1.10.0

C:\Users\student\Election1> truffle init
Starting init...
=====
> Copying project files to C:\Users\student\Election1
Init successful, sweet!

Try our scaffold commands to get started:
  $ truffle create contract YourContractName # scaffold a contract
  $ truffle create test YourTestName        # scaffold a test

### **Conclusion:**

Ganache and Truffle are crucial tools in creating a personal Ethereum blockchain. Ganache provides a local, lightweight Ethereum network for development and testing, making it easy to experiment with smart contracts and DApps. Truffle, on the other hand, offers a robust suite of development and deployment tools, simplifying the process of creating and managing smart contracts on Ethereum. Together, they streamline the development cycle, enhance efficiency, and reduce the complexity of building and testing Ethereum-based solutions. In conclusion, Ganache and Truffle play indispensable roles in facilitating the creation and deployment of personal Ethereum blockchains for development and experimentation.
